

ABSTRACT

A manipulation button (62) of a first attitude adjusting mechanism (27) is located at a corner on a front side of a lower case (23), so that the manipulation button (62) can be operated with fingers of one hand while both corners of the front side of the lower case (23) is supported with both hands in controlling the attitude of a projector, thereby enabling to conduct adjustment work with the projector being stably supported to make it unlikely for an inclination in right and left direction approximately orthogonal with front and back direction of the projector, thus improving workability during attitude adjustment process of the projector.
